

**FEATURES**

- Guaranteed Operation at +1.2V Op Amp and Reference on Single Chip
- Low Supply Current 400 $\mu$ A
- Capable of Floating Mode Operation
- Low Reference Drift 20ppm/ $^{\circ}$ C
- Low Offset Voltage
- Output Swings to Within 15mV of Rails

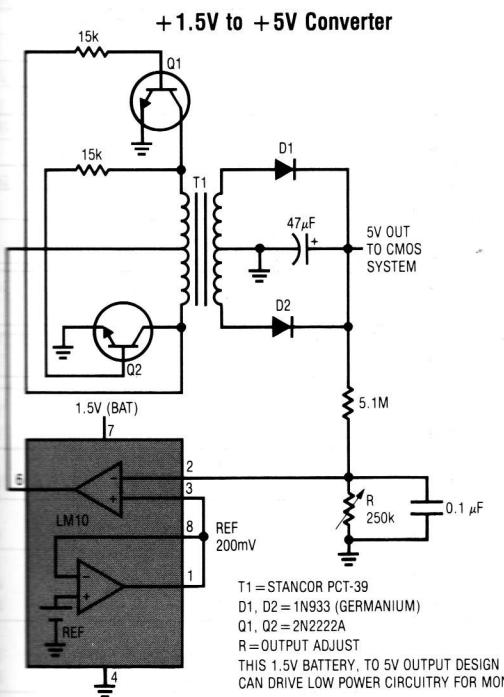

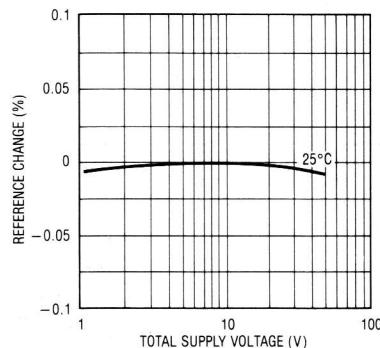

**APPLICATIONS**

- Remote Signal Conditioner / Transmitter
- Battery Operated Instruments
- Precision Current Regulators
- Precision Voltage Regulators
- Thermocouple Transmitter

**DESCRIPTION**

The LM10 combines a precision reference, a reference buffer amplifier and an independent, high quality op amp on a single chip. The device is capable of operation from a single supply as low as 1.1V, from dual supplies up to  $\pm 20$ V and typically draws 270 $\mu$ A supply current. Input voltage range for the op amp includes ground, while the unloaded output can swing to within 15mV of each rail. Further, the LM10 will deliver 20mA output current and still swing within  $\pm 400$ mV of the supply rails.

With its low operating current and floating operation capability, the LM10 is ideal for two wire analog transmitter circuits where the processed signal is carried on the same line used for power. The LM10 is suggested for portable battery powered equipment and is fully specified for operation from a single 1.2V battery. Other applications include precision current and voltage regulators, operating from very low voltages to several hundred volts.

**Line Regulation**

**ABSOLUTE MAXIMUM RATINGS**

Total Supply Voltage

LM10/LM10B/LM10C ..... 45V

LM10BL/LM10CL ..... 7V

Differential Input Voltage (Note 1)

LM10/LM10B/LM10C .....  $\pm 40V$ LM10BL/LM10CL .....  $\pm 7V$ 

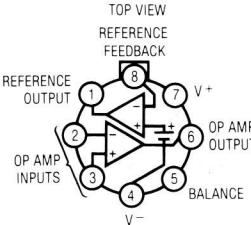

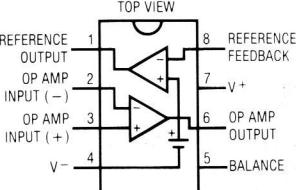

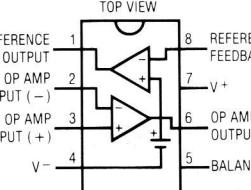

Output Short Circuit Duration ..... Indefinite

Operating Temperature Range (Note 2)

LM10 .....  $-55^{\circ}C \leq T_A \leq 125^{\circ}C$ LM10B/LM10BL .....  $-25^{\circ}C \leq T_A \leq 85^{\circ}C$ LM10C/LM10CL .....  $0^{\circ}C \leq T_A \leq 70^{\circ}C$ Storage Temperature Range .....  $-65^{\circ}C \leq T_A \leq 150^{\circ}C$ 

Lead Temperature (Soldering, 10 sec.) ..... 300°C

The ● denotes the specifications which apply over full operating temperature range.

**Note 1:** The input voltage can exceed the supply voltages as long as the voltage from the input to any other terminal does not exceed the maximum differential voltage, and the maximum junction temperature is not exceeded due to the excess power dissipation that occurs when the input voltage is less than the negative supply voltage.

**Note 2:** The maximum operating junction temperatures are: 150°C for the LM10; 100°C for the LM10B and LM10BL; and 85°C for the LM10C and LM10CL. Package derating factors will be found on the back page of this data sheet.

**Note 3:** These specifications apply for the following conditions unless otherwise noted:

at 25°C

over temperature

$$(a) V^- \leq V_{CM} \leq V^+ - 0.85\text{V} \quad V^- \leq V_{CM} \leq V^+ - 1.0\text{V}$$

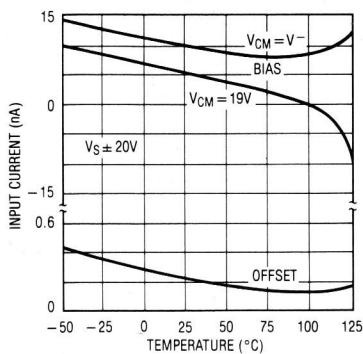

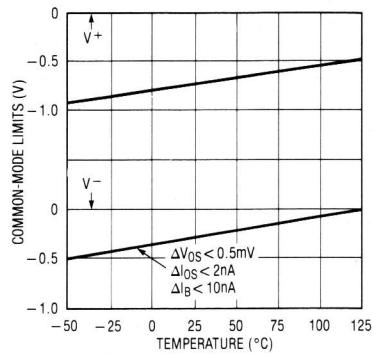

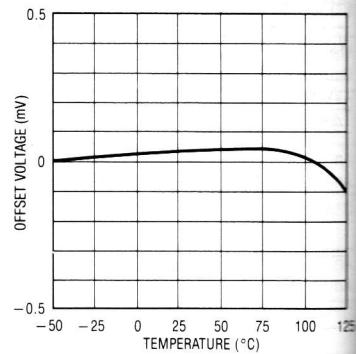

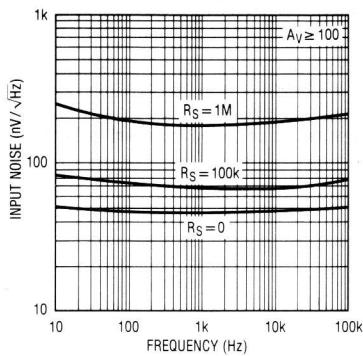

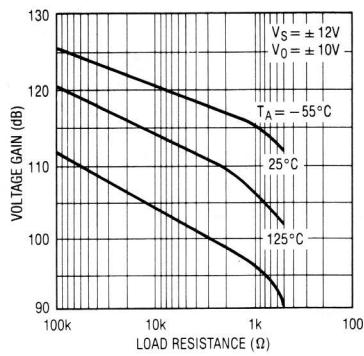

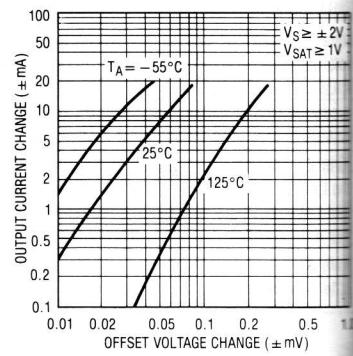

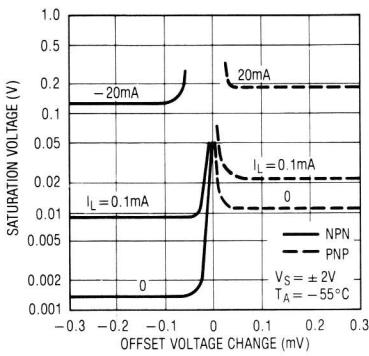

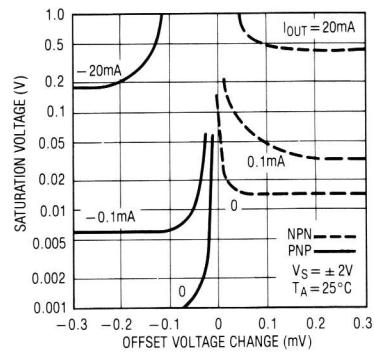

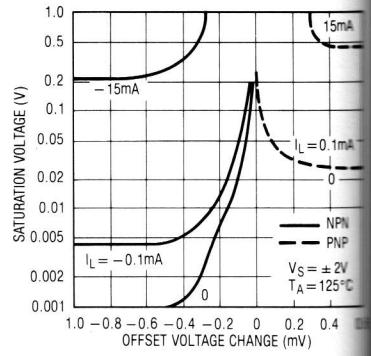

$$(b) 1.2\text{V} \leq V_S \leq V_{MAX} \quad 1.3\text{V} \leq V_S \leq V_{MAX}$$

$V_{REF} = 0.2\text{V}$  and  $0 \leq I_{REF} \leq 1.0\text{mA}$  where  $V_{MAX} = 40\text{V}$  for the LM10, LM10B and LM10C and  $V_{MAX} = 6.5\text{V}$  for the LM10BL and LM10CL. The specifications do not include errors due to thermal gradients ( $\tau_1 \approx 20\text{ms}$ ), heating ( $\tau_2 \approx 0.2\text{ sec}$ ) or package heating.

**Note 4:** For  $T_J > 90^\circ\text{C}$ ,  $I_{OS}$  may exceed 1.5nA when  $V_{CM} = V^-$ . When the common-mode input voltage is within 100mV of the negative supply and  $T_J = 125^\circ\text{C}$ , the offset current will be less than 5nA.

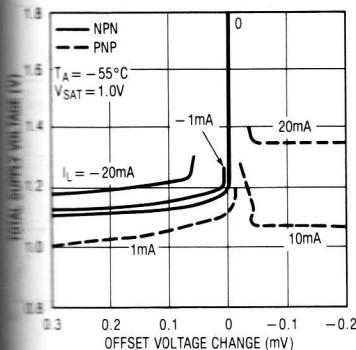

**Note 5:** Shunt gain defines the operation in floating applications when the output is connected to the  $V^+$  terminal and input common-mode is referred to  $V^-$  (see typical applications). The effects of larger output voltage swing with higher load resistance can be accounted for by adding the positive supply rejection error.

**Note 6:** Guaranteed by design.
